Jan 2026 to Present: Founder & Lead Software Engineer, iDelivery, University of Fort Hare

Founded and lead a live hyperlocal food delivery platform serving the University of Fort Hare community. Responsible for full-stack architecture, deployment, and ongoing iteration across three distinct user portals (Customer, Restaurant, Driver), including database design, REST API development, and user onboarding.

- Digitised operational workflows across 3 user portals by architecting and deploying a React/TypeScript platform with a PostgreSQL backend.
- Improved platform reliability by analysing real user feedback and implementing targeted architecture changes across customer, restaurant, and driver workflows.

Dec 2025 to Present: Software Developer / Full-Stack Engineer, P&C Solutions

Contracted as a remote full-stack developer for P&C Solutions, responsible for building the company's public-facing website and developing full-stack web applications for client engagements, collaborating directly with the CEO, designers, and client representatives across the full software development lifecycle.

- Built and deployed PMC Solutions' public-facing company website, contributing directly to an increase in client enquiries and new business leads.
- Secured a UK-based client engagement generated from the new website, and developed a full-stack housing application covering property buying, renting, and lease workflows.

May 2026 to Present: Independent Developer (Unpaid), FIFA World Cup 2026 Match Prediction & Betting Analytics

Independently designed, built, and maintain an end-to-end machine learning pipeline predicting international football match outcomes and identifying value bets against bookmaker odds, using a dataset of over 50,000 international matches dating back to 1872. Currently migrating the pipeline's data infrastructure to Microsoft Fabric as part of ongoing Microsoft certification study.

- Achieved 59.4% three-class prediction accuracy on held-out 2018 and 2022 World Cup data, exceeding the 33% random baseline, by engineering 27 features including Elo ratings and weighted form.
- Built an Expected Value and Kelly Criterion staking engine against live bookmaker odds by calibrating model probabilities using Platt Scaling.
- Automated model deployment and retraining using GitHub Actions CI/CD, publicly documented at github.com/RrePitso, and am now rebuilding the pipeline's data layer on Microsoft Fabric to align with enterprise data engineering practice.

Jul 2026 to Present: Independent Developer (Unpaid), Generative AI Knowledge Management System (Email RAG)

Independently designed and built an agentic email triage assistant using LangChain, LLMs, and tool-calling to classify, prioritise, and extract actionable data from unstructured email text, grounded by a Retrieval-Augmented Generation (RAG) pipeline over a vector database.

- Reduced hallucinated AI responses by engineering a RAG pipeline over a Chroma vector database to ground every classification decision in retrieved historical context.
- Built a natural-language chat interface using Streamlit, enabling users to query their own email history and receive grounded, explainable answers.

Jun 2026 to Sep 2026: Systems Development & Data Specialist, Dynamic DNA (DVT Group / MICT SETA)

Selected for a competitive, government-sponsored scarce-skills data academy within the Dynamic Technologies (DVT) group, engineering enterprise-grade cloud data architectures and analytical models within the Microsoft Azure ecosystem.

- Earned Microsoft Certified: Azure Data Fundamentals (DP-900) by completing structured Azure training alongside academy project work.
- Designed scalable, production-ready data pipelines and database repositories to support business intelligence reporting functions.

Feb 2023 to Present: BSc Computer Science (Mathematics Major), University of Fort Hare

Followed a full-time course of study in Computer Science with a Mathematics major, covering programming, data structures and algorithms, database management and design, software engineering, computer networks, operating systems, and advanced mathematics including calculus, linear algebra, and complex analysis. Coursework complete; final examination scheduled for December 2026.

- Achieved distinction-level results (85%+) in three first-year modules, including Introduction to Computing and Programming Concepts, by building strong foundational programming logic.
- Achieved a distinction (76%) in Operating Systems by applying strong systems-level programming understanding in third year.

Jan 2015 to Dec 2019: Matric, Science Stream, A.B. Phokompe Senior Secondary School

Completed secondary schooling in the Science stream, with a curriculum emphasising Mathematics, Physical Science, and English.

- Ranked as Top 2 Matriculant in graduating class by achieving an overall average above 81%.
